through life

Pgam advanced technologies ltd.

Pgam advanced technologies Ltd has been in business for over 30 years specialising in speciality vehicle engineering and manufacture. Projects undertaken by Pgam range from concept Engineering through to volume production and through life logistic support.

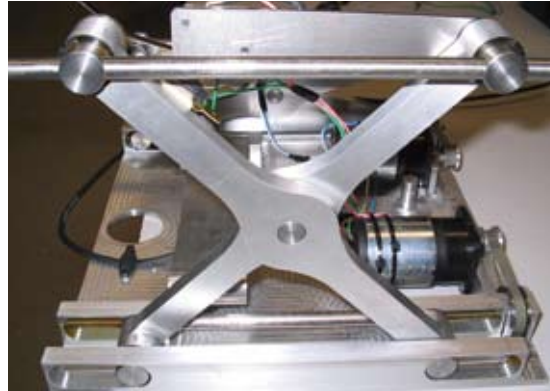

Pgam, with the support of other organisations within the farmingtons group, is capable of undertaking a variety of vehicle conversion and armoured projects on a wide range of vehicle types using a broad range of materials. This provides our clients with confidence that the product delivered is the best solution balancing cost, weight and protection.

Services offered by Pgam

- Vehicle / systems engineering
- Configuration control
- Low volume systems and vehicle production
- Volume vehicle and systems production
- Vehicle armoured
- Vehicle / systems validation
- Systems integration
- Systems interoperability assessment
- Electronic systems installation
- ECM Installation
- Communications systems installation
- Driver and user training
- In – service support
- Vehicle assessments to VSAG requirements

Locations and Facilities

Pgam operates from secure facilities located in Warwickshire, comprising Engineering offices, Workshops and Test Track

Technology

All projects undertaken by Pgam draw upon state of the art facilities from the entire farmingtons group of companies to provide.

Project management

A team of automotive industry qualified project managers, utilising recognised automotive, project management tools, will deliver projects to agreed time and cost requirements.

Vehicle Integration

The installation of customer equipment in to a COTS platform presents many challenges in respect to packaging and interoperability of the installed equipment with existing vehicle systems. Pgam has the in house expertise to integrate a wide range of equipment in to most vehicle platforms and present a robust and discrete solution that works in harmony with other on board vehicle systems.

Concept and Production Manufacturing

Technicians, supported by production engineers, work together to develop the most effective solution, to meet cost, performance and mass targets. Manufacturing facilities include CNC laser cutting and machining and low volume steel and plastics processing facilities.

Validation and Certification

Performance requirements of vehicles and systems are understood at the concept stage and continuously verified throughout the development phase. Final validation on production intent systems will confirm that system requirements have been met.

Integrated Logistics Support

- Pre-Deployment Operator Training
- Technical Publications
- Spares support
- In theatre service and maintenance support
